

How we Calculate Your ROI

This short guide outlines the method behind our ROI calculator, so you can see how the estimates are generated and sense-check them against your own internal figures.

Our enhanced learning solutions are designed to reduce training time, improve completion rates, and free up valuable staff hours. The calculator gives a quick estimate of the potential time and cost savings based on a few key inputs.

How it's calculated

- **Saved hours** = number of courses x number of employees × 32%(FastTrack learners) x time saved per course (in hours)
- **Amount saved** = saved hours × average hourly wage (based on selected salary amount)

Key assumptions

- The average course duration is 30 minutes
- Learners who pass FastTrack complete a 10-minute version instead of the 30-minute version, saving 20 minutes (0.333 hours)
- 32% of learners pass via FastTrack (on average) and benefit from this time-saving
- All staff are expected to complete all assigned training annually

Notes

These figures are intended as a general guide. In many cases, the ROI may be understated, especially when additional benefits such as improved learner engagement, reduced repeat training, and platform efficiencies are considered.
